Hon. Sabrina Turner, MP

Minister for Health & Wellness

Health for all.

That is the theme for this year's World Health Day, celebrated in April.

Health for all has been an underlying driver in the work of the Ministry of Health and Wellness, and is a key factor fuelling our vision to revamp public health and embrace a data-driven approach to health care policies, services and education.

Behind the scenes at the Ministry, our team has been working to roll out the upcoming STEPS 2023 national health survey. A long overdue exercise, STEPS will allow us to determine the national prevalence for non-communicable diseases (NCDs), as well as their risk factors, in Cayman. We know that heart disease, cancer, diabetes and respiratory illnesses are responsible for the majority of deaths within our islands every year, but to date we still do not know the true impact of these NCDs within our shores.

The cost of not knowing is simply too high, and one which I know we are all unwilling to keep paying. We cannot proclaim lofty goals such as health for all without doing the work necessary to reach it.

We are doing our part, but we cannot do it alone.

To fully understand the true picture of the health of the nation, **we need your support and participation.** In this issue of the Public Health Spotlight, as well as in your district, on the radio, social media and via zoom, the Ministry team is laying out the details of the STEPS 2023 national health survey so that we can ensure that we maximise participation to be able to collect good, reliable data that will help shape the future of healthcare within our islands.

The quality of the data we collect is based entirely on your participation, and data is key in achieving health for all. Will you help shape Cayman's healthcare?

We remain at your service.

Understanding the STEPS 2023 National Health Survey

The Ministry of Health and Wellness will be undertaking the STEPS 2023 National Health Survey from 3 June- 31 July, 2023

STEPS is a standardised tool utilised by governments around the world to determine the national prevalence for non-communicable diseases (NCDs) as well as the risk factors for those NCDs.

The Cayman Islands last undertook the STEPS Survey in 2012. Some key results from STEPS 2012 was that 7 out of 10 adults in the Cayman Islands are overweight or obese, and as many as 40% had raised blood pressure.

Key findings from STEPS 2012

7 out of 10 Cayman residents are overweight or obese.

40% of Cayman residents have raised blood pressure

Cayman has undergone some significant changes in the last ten years, not least of which has been the COVID-19 pandemic. As such, the time has come to properly assess the health of the nation and properly determine the national prevalence for heart disease, diabetes, cancer and respiratory illnesses, all of which make up the top five leading causes death among Cayman residents.

STEPS is different from other survey tools in that it is made up of three key components.

STEP 1

Questionnaire

- Health behaviour questions (ie: diet, exercise, smoking)
- Current and historic health questions

STEP 2

In-home measurements

- Height
- Weight
- Blood pressure
- Waist circumference*
- Hip circumference*

**measurement will be taken by participant*

STEP 3

Finger-prick blood measurements

- Cholesterol
- Glucose

In utilising an approach that incorporates both a questionnaire and the collection of objective data (measurements) STEPS gives us insight into the connection between the health behaviours and lifestyle choices and a person's health profile. STEPS 2 and 3 also provide participants with a mini health screening, the results of which will be shared with participants and any potential issues will be flagged for follow up.

STEPS is a randomised survey, which means that 3,300 individuals between the ages of 18-69 will be chosen to participate. These individuals will be chosen from all three islands- Grand, Brac and Little- and the households from each district will be chosen based on a representative sample of the population for each location. Once a STEPS 2023 enumerator arrives at the home, he or she will utilise a special app to select the randomly participant from each household if more than one is eligible.

While the STEPS 2023 survey is designed to collect sensitive personal information, the STEPS survey will be collated and anonymised in keeping with international best practices and data protection legislation. Once the data from STEPS 1, 2 and 3 has been linked, the dataset will be anonymised and personal information will be removed. This means that no one will be able to identify any participant's personal responses and results, and the only person who will be able to access personal health records will be the participant him/herself and any health care provider to whom they choose to release their records.

STEPS is a voluntary survey. However, it is important to note that once chosen a participant can't be replaced- neither by someone else in the home nor by choosing another household. Replacing participants or changing households would introduce bias into the survey, so it cannot be done.

Thus, it is crucial for all Cayman residents to be aware of the STEPS 2023 national health survey and to understand the importance of participation should they be chosen.

The results from the STEPS 2023 national health survey will allow not only the Cayman Islands Government, but health services providers, partners in health education, and NGOs to take a data driven approach to policy development, service provision, and prevention and education programming.

Proactive Prevention: Alcohol

A Global Outlook

While alcohol is often treated as an acceptable part of daily life and social events, the harmful use of alcohol has had serious health and economic implications for the global community. According to the World Health Organization, the harmful use of alcohol is responsible for approximately 3 million global deaths every year, with 13.5% of total deaths among 20-39 year olds attributable to harmful alcohol use. As a causal factor in the occurrence of more than 200 diseases and other health conditions, alcohol accounts for 5.1% of the global burden of disease and injury. The majority of this disease burden occurs from unintentional and accidental injuries including vehicle accidents, violence, and suicide. The harmful outcomes of alcohol can be prevented, however, a greater proactive approach is required.

Alcohol in the Cayman Landscape

The Cayman Islands Student Drug Use Survey (CISDUS) has revealed that alcohol has remained the top substance of choice among teens since it began collecting data in 1998, with 1 in 3 teens reporting alcohol-related problems in the 2020 survey. The adult population also mirrors the harmful effects of alcohol, with the Royal Cayman Islands Police reporting a 37% increase of DUIs in 2021, with 26% involving a driver that was at least twice the legal blood alcohol concentration limit. To prevent these alcohol-related harms, regulatory approaches and responsible serving and selling of alcohol can make a real difference for our community.

A Proactive Approach to Prevention

The National Drug Council (NDC) offers support for establishments that sell or serve alcohol in the prevention of intoxication, drunk driving, and underage drinking through the provision of Training for Intervention ProcedureS (TIPS) for their staff. TIPS is an internationally recognized certificate programme that equips servers and sellers of alcohol with fundamental skills for preventing alcohol-related harms and helps to align sales and services with local regulations.

Over the past 20 years a total of 31 establishments and over 536 individuals have done their part in keeping our community safe by completing TIPS training with the NDC. Let's continue to work together to reduce the harmful effects of alcohol on our community and prioritise public health and safety. Remember that responsible decisions today can make a big difference in ensuring a safer tomorrow.

COVID-19 Surveillance Data

March 2023 (data as of 3 April 2023)

Key points

Locally:

During March 2023, there was a small increase in the number of individuals admitted to hospital who tested positive for COVID-19 compared to February 2023. This includes both individuals admitted for morbidity relating to their SARS-CoV-2 infection, and those who test positive for COVID-19 when screened on admission and receiving care for other medical needs. There was one COVID-19 death reported in March 2023.

Figure 1: Weekly hospitalisations and deaths (since 8 September 2021^a)

^a First COVID-19 patient was in March 2020, but hospitalisation figures begin September 2021 for graphical reasons.

Table 1: COVID-19 patients admitted to hospital

Indicator	March 2023	February 2023	Percentage change
New COVID-19 patients admitted ^b	20	17	18%
New admissions with ≥ 2 doses of a COVID-19 vaccine ^b	14	11	27%
COVID-19 patients discharged	16	14	14%
Supplemental O2 inpatients ^c	5	3	67%
Ventilated inpatients ^c	0	0	0%

^b Admissions include patients who are detected as being COVID-positive on screening.

^c Inpatient indicators are based on data received at the point of admission.

Table 2: COVID-19 vaccine uptake and coverage within the previous month.

Dose Number	Number administered in the month	Total Count	Coverage of Total Population ^d	Coverage of population over 5 ^d
Primary course 1	62	62,085	86.9%	95.9%
Primary course 2	37	60,664	84.9%	93.7%
2021/22 Booster	0	23,180	32.5%	35.8%
2022 Booster	0	2,759	3.9%	4.3%
Autumn 2022/2023 Booster	107	2,250	3.1%	3.5%

^d Based on a Total Population of 71,432.

Figure 2: Vaccine uptake over time

Figure 3: Cumulative Autumn booster uptake over time by age group.

Avian Influenza

Chile reported a confirmed human case of avian influenza to the Pan American Health Organization/World Health Organization (PAHO/WHO) on 29th March 2023[1].The infection was caused by avian influenza A (H5) virus. The case was admitted to hospital and kept in respiratory isolation. This is the first human case of avian influenza reported in Chile, and the third human case reported in the Region of the Americas in the past year. To date, no avian or human cases have been identified in the Cayman Islands.
